

GTK+2 is very build-able on MAC OS X 10.3 with X11.  
 ./configure --help  
 ./configure withoptions  
 make  
 sudo make install  
 ...should handle most cases. JPEG-6B needs a modern  
 config.sub & config.guess. FONTCONFIG comes with the  
 X11 package, but once you build PKGCONFIG, you need  
 to tell it where to find Apple's built tools. Make sure  
 PANGO configures with the X and XFT backends.
